

Forklift Fork Positioner

Fork Positioner for Forklifts - The fork positioner is actually a hydraulic device that could allow the driver to operate the forklift without leaving the seat. They are constructed out of top quality materials and are designed to be able to endure the most demanding operations and work surroundings. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate more precise lifting and position in a faster and more effective way.

The fork pocket is somewhat unique and can enable the individual operating it to be able to securely sway the blades into position without any worry of destroying the positioning cylinders. This can allow the driver the choice to execute independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be converted into blade positioners on available units.
